

React Redux

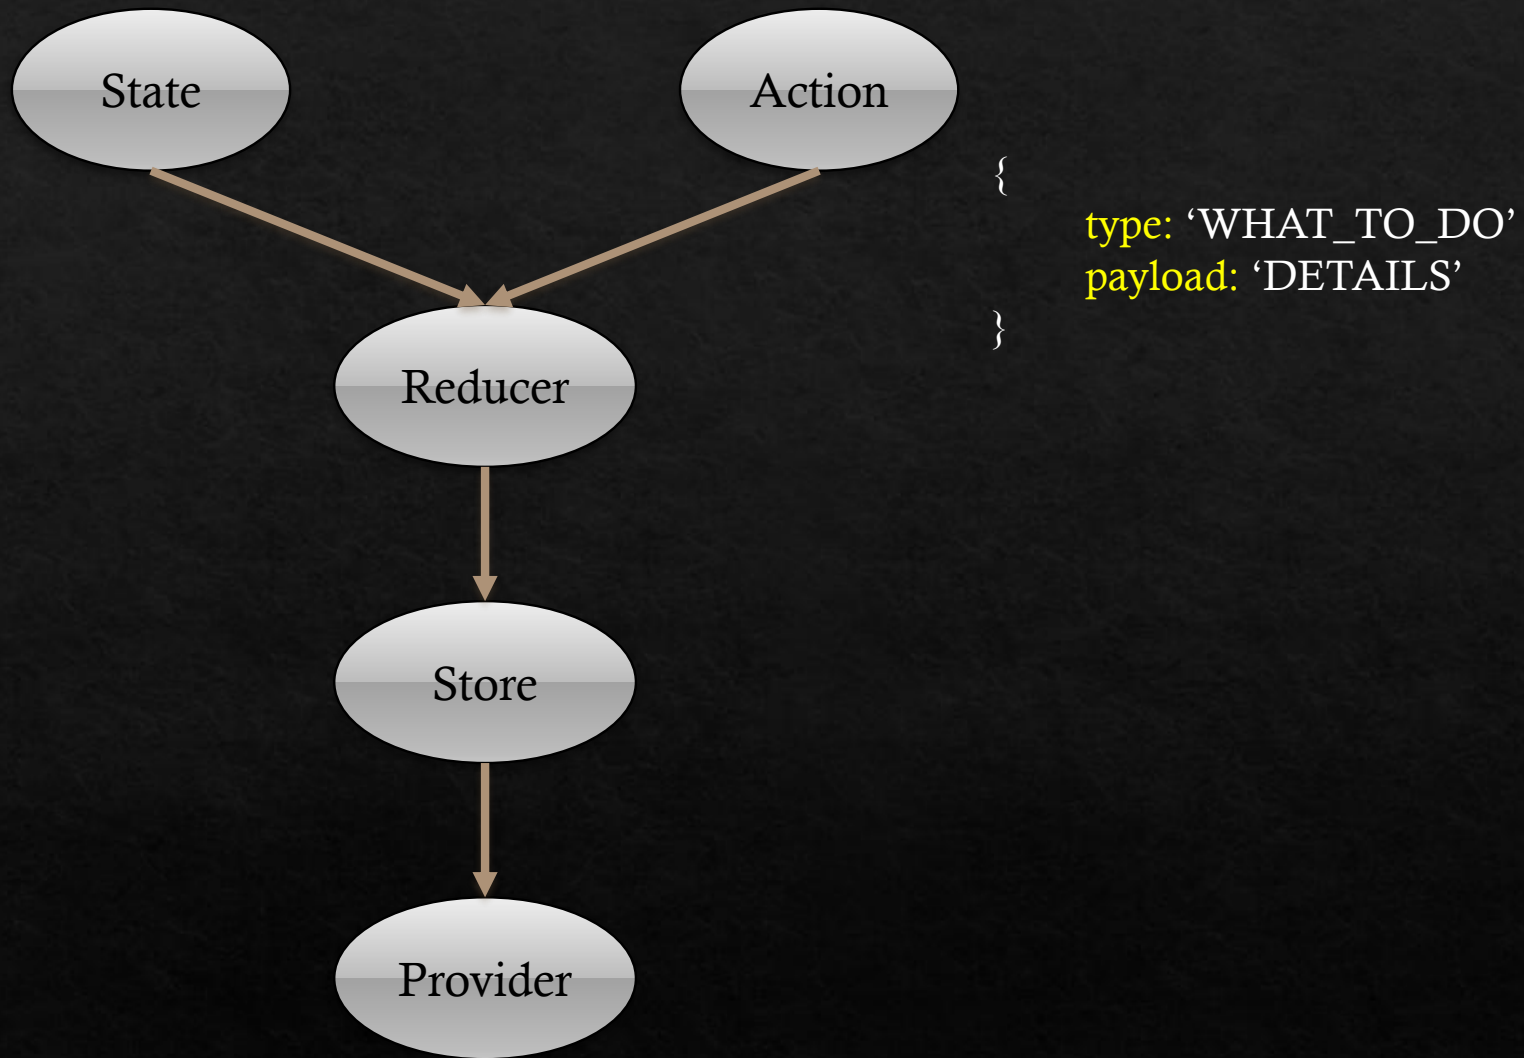

Redux

JavaScript Library for
state management

- ❑ Store
- ❑ Reducer
- ❑ Action
- ❑ Constant

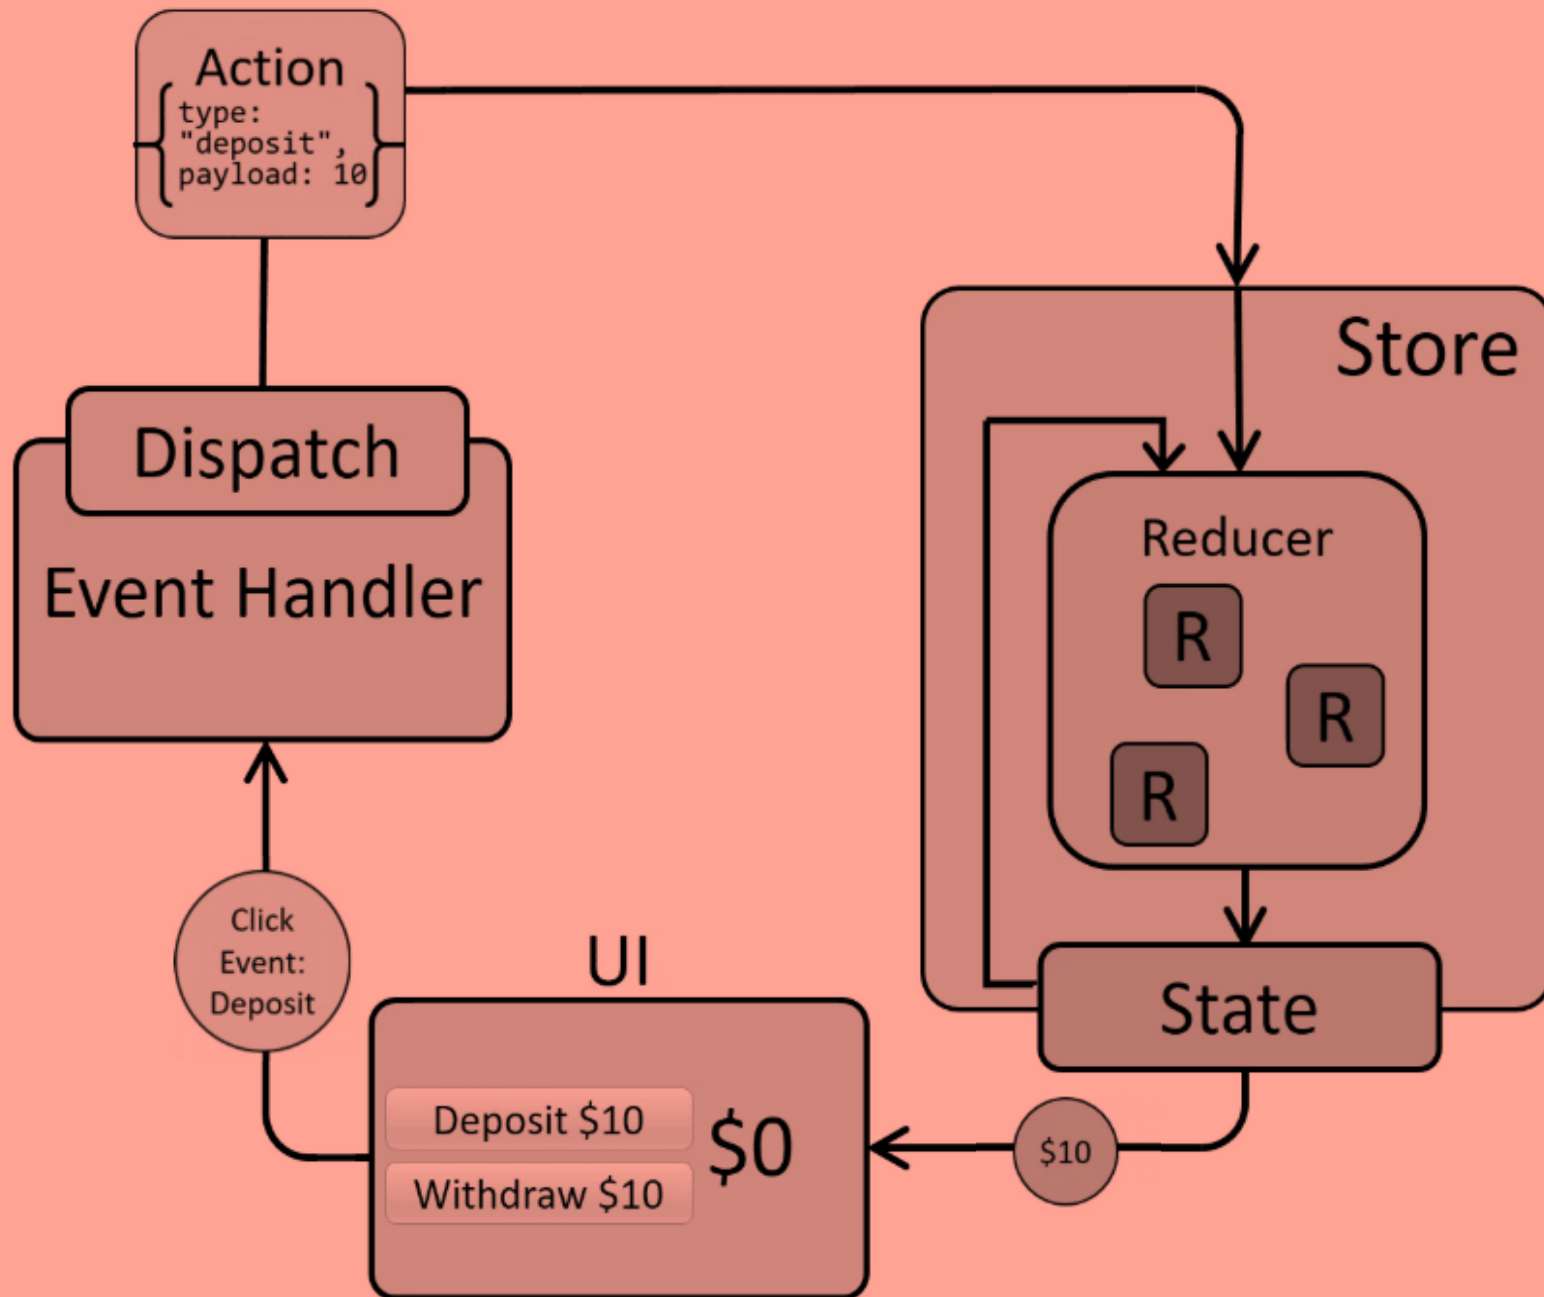

React-Redux

- ❑ Provider
- ❑ useSelector()
- ❑ useDispatch()

Key Concepts:

- ❑ **Redux Store:** The single source of truth for the entire application state. All state changes are managed within this central store.
- ❑ **Actions:** Plain JavaScript objects that describe what happened in the application (e.g., 'ADD_ITEM', 'UPDATE_USER'). They are the only way to trigger state changes. It may contain some additional information or payload.
- ❑ **Reducers:** Pure functions that take the current state and an action as input, and return a new state. They specify how the application's state changes in response to actions.
- ❑ **Provider Component:** A React Redux component that makes the Redux store available to all nested components within your React application.
- ❑ **useSelector Hook:** A React Redux Hook that allows functional React components to extract data from the Redux store.
- ❑ **useDispatch Hook:** A React Redux Hook that allows functional React components to dispatch actions to the Redux store, triggering state updates.

**Thank
You**
